

Proc Mixed for Repeated Measures Data

(by a Non-statistician)

Jaswant Singh
Veterinary Biomedical Sciences

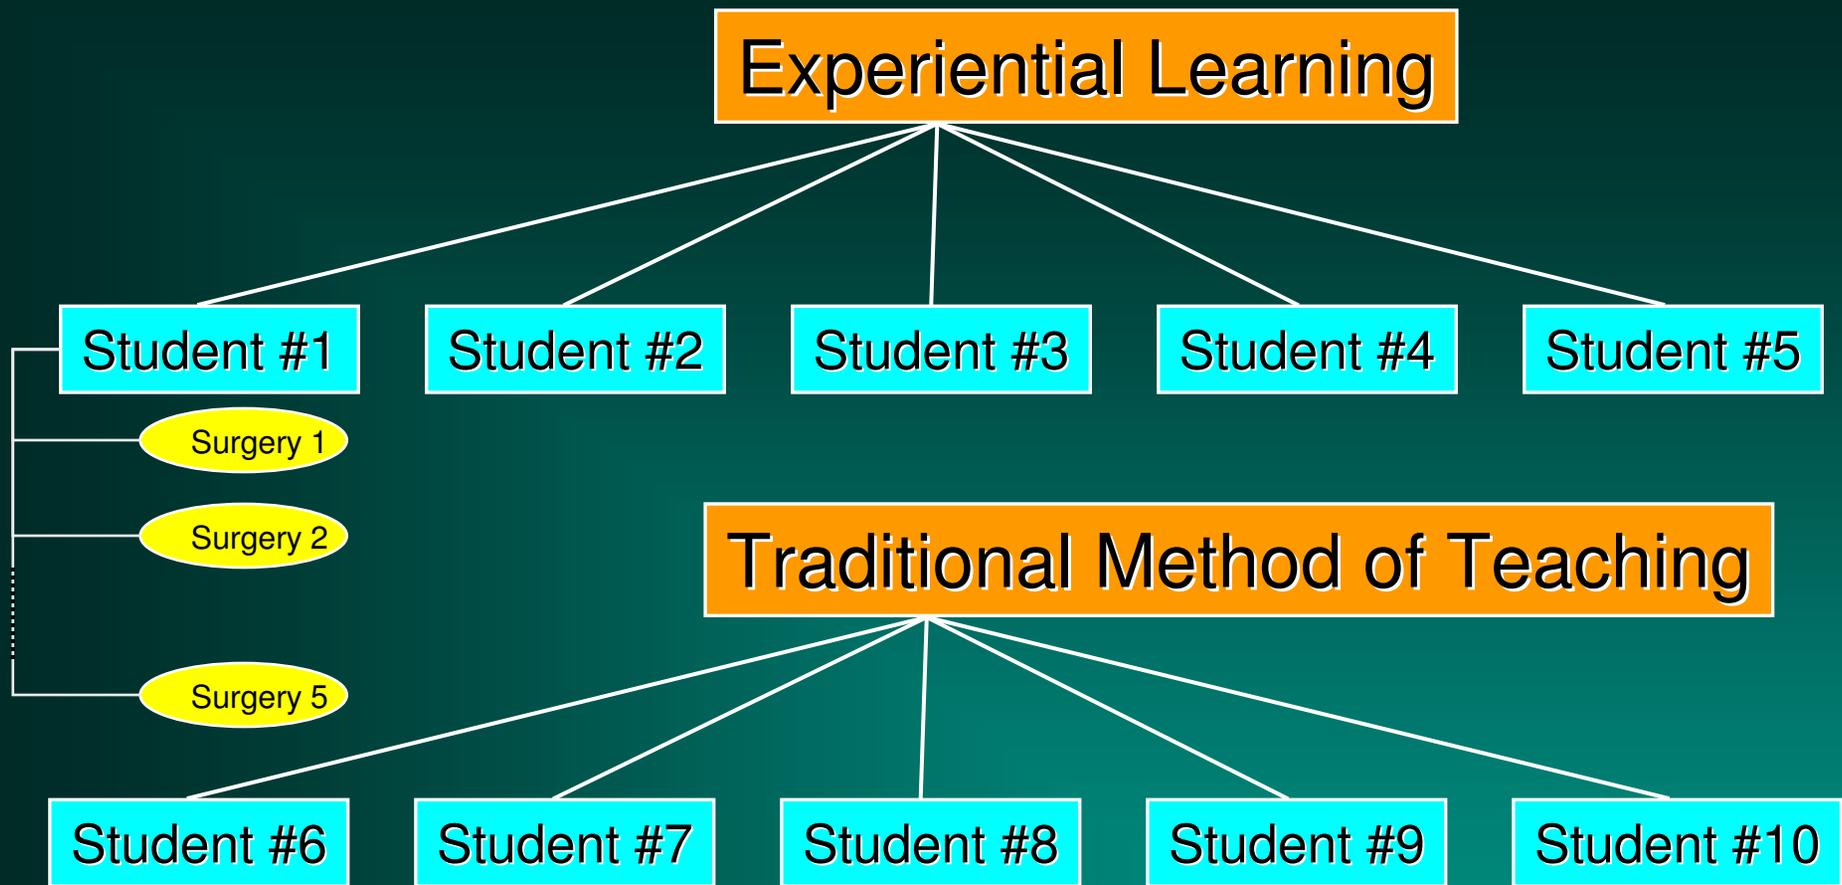

Most researchers use statistics the way a drunkard uses a lamp-post – more for support than illumination

- Winfred Castle

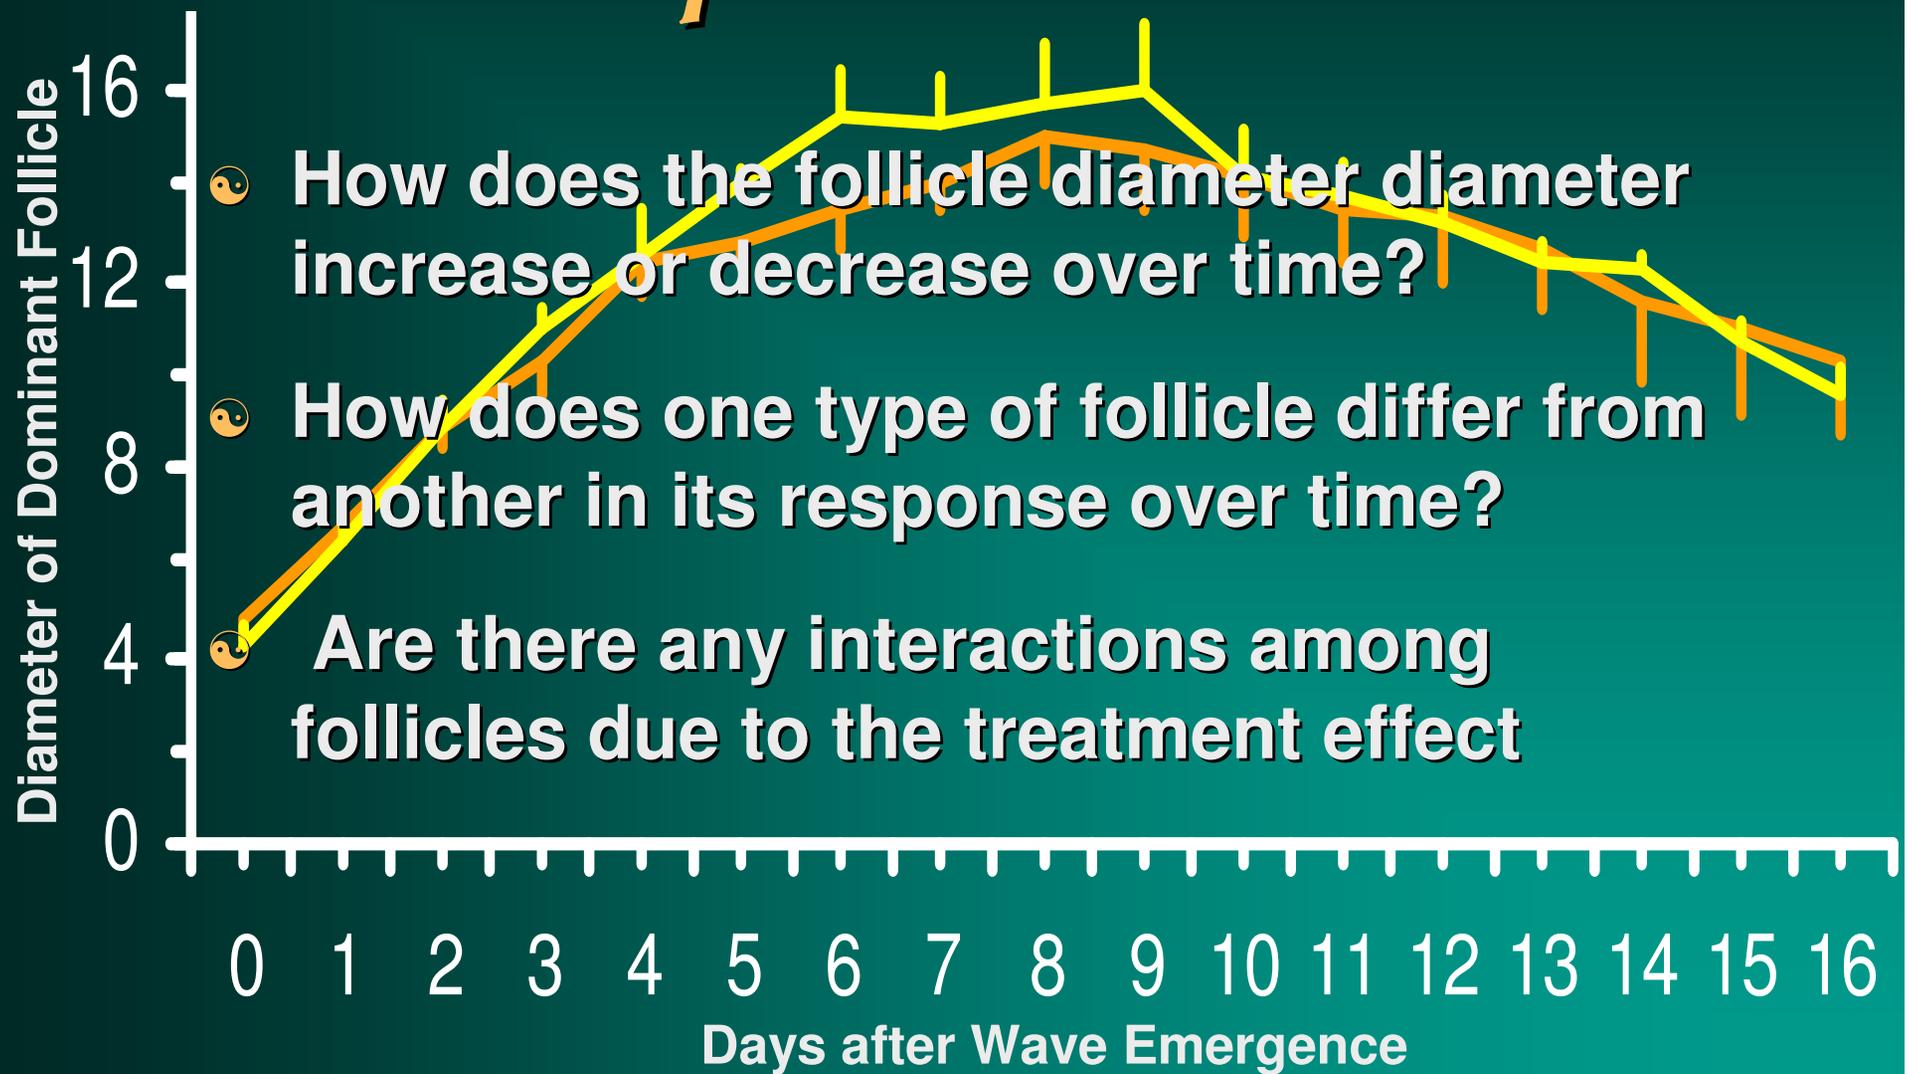

A random factor contains only a sample of the possible levels of the factor, and the intent is to generalize to all other levels

- ☯ Animal ID is nested within treatment
- ☯ Our model statement for split-plot design will look like:
 Model Diameter = trt animal(trt) day trt*day
- ☯ Animals are considered a 'random factor' in the analysis

- 👁️ **Student ID is nested within Method**
- 👁️ **Students are considered a 'random factor' in the analysis**

Our questions are:

What do we want to accomplish?

- ☯ **To analyze time series data**
- ☯ **To find out if there is a treatment effect**

Experimental designs

	Control	Estradiol 0.1mg i/m	Estradiol 0.5mg i/m	Estradiol 1.0mg i/m
Animal ID in each group →	12	69	11	68
	14	71	23	70
	21	9	20	8
	34	6	33	5
	58	31	57	30

- ☯ **Experimental Units: Animals**
- ☯ **Experimental Design: Completely random or one-way**
- ☯ **Treatment Design: Gradient**
- ☯ **Response Design: Repeated**

SAS[®] PROC MIXED

- **A new analysis tool which is appropriate for analyzing repeated measures data because it models the covariance of the data as well as the mean and the variance.**
 - In repeated measures data, the data collected at one point in time is often not independent of the data collected at another time in the study (i.e., heterogeneity of residuals, the existence of covariance in your data set).
- **Capable of analyzing data with missing values.**

Correlation Matrices

1	0	0	0
0	1	0	0
0	0	1	0
0	0	0	1

Independent

No correlation

1	α	α	α
α	1	α	α
α	α	1	α
α	α	α	1

Compound Symmetry

Fixed and constant Correlation within a subject is presumed

1	α_{21}	α_{31}	α_{41}
α_{21}	1	α_{32}	α_{42}
α_{31}	α_{32}	1	α_{43}
α_{41}	α_{42}	α_{43}	1

Unstructured

Correlation matrix is completely unspecified

1	α	α^2	α^3
α	1	α	α^2
α^2	α	1	α
α^3	α^2	α	1

Autoregressive

Correlation decrease with distance

SAS[®] PROC MIXED

🕒 Assumptions:

- Data is normally distributed**
- Variances and covariances of the data exhibit a structure matching one of those available in PROC MIXED**
- Means (expected values) of the data are linear in terms of a certain set of parameters**

SAS[®] PROC MIXED:

How does it work?

- ☯ **Run PROC MIXED using different covariance structures:**
 - *Compound Symmetry* CS
 - *Huynh-Feldt* HF
 - *Unstructured* UN, UN(1)
 - *Autoregressive* AR(1)
- ☯ **Select the model with the best fit**
 - The highest (i.e., most positive) values of Akaike's Information and Schwarz's Bayesian Criterion

First thing first

Test of Homogeneity of Variance

```
proc glm;  
  class trt;  
  model folliclediameter = trt;  
  means trt / hovtest;  
run;
```

The Syntax

data;

```
input trt id day folliclediameter;  
cards;  
.. .. .. ..  
.. .. .. ..
```

proc mixed;

```
class id trt day;  
model folliclediameter = trt day trt*day / htype=3;  
repeated day / subject=id(trt) type=*;
```

run;

Run multiple analyses by replacing * with

CS for Compound Symmetry

HF for Huynh-Feldt

UN, UN(1) for Unstructured

AR(1) for Autoregressive

SAS[®] PROC MIXED:

Which model do we use?

	Akaike's Criterion	Schwarz's Criterion
CS	-280.9	-283.2
AR(1)	-245.1	-245.4
UN	No fit	No fit
UN(1)	-306.2	-308.7
HF	No fit	No fit

SAS[®] PROC MIXED

- **To determine where differences exist:**
 - Least Squares Means
 - Contrasts
 - Estimates
- **In contrast to PROC GLM, PROC MIXED averages across the repeated measures and computes standard errors accounting for the appropriate covariance structure.**

SAS[®] PROC MIXED

- PROC GLM provides more extensive results for the traditional univariate and multivariate approaches to repeated measures
- PROC MIXED offers a richer class of both mean and variance-covariance models, and you can apply these to more general data structures and obtain more general inferences on the fixed effects

SAS[®] PROC MIXED
