### Undergoing major surgery performed by a robot

Again, it is important not to focus too much on the lower percentages in countries with the more established health systems. It is still very interesting that fully one-quarter of people in the UK, and almost one-third in Germany would be willing to have major surgery conducted by a robot in place of a human. That represents millions of operations a year.

These findings are telling and point towards a greater – and in some countries almost complete – acceptance of AI and robots for delivering many different types of healthcare services, treatments and procedures.
