Why Artificial Intelligence is key to Defence & Security?

Automating ISR Sensor Feeds enable Data to Decision

Artificial Intelligence and Automated Processing augments intelligence analysis, reducing risk and delivering improvement to existing mission processes; the capability is realised through a single solution underpinned by SAS Viya Platform an open intelligence framework.

Deploy event stream processing (ESP) within an aircraft or vehicle that is equipped with sensors and leverage either SAS or open source AI computer vision models in real-time to:

A use case regarding real-time intelligence, surveillance, and reconnaissance (ISR) sensor analysis.

- Prioritise and assign the most cost-effective method of streaming sensor data
- Reduce risk and prompt the right focus to relevant feeds, based on mission-specific activity
- Provide a more effective approach for creating mission summary reports through visualisation
